1. Install the Mysql driver as a module in Wildfly
   1.1 Copy the Mysql driver(eg mysql-connector-java-5.1.38-bin.jar) to %JBOSS_HOME%/modules/system/layers/base/com/mysql/main
   1.2 In %JBOSS_HOME%/modules/system/layers/base/com/mysql/main/module.xml fill in the path in the resource-root section in order to point to the jar copied at 1.1

   Eg: <resources>
       <resource-root path="mysql-connector-java-5.1.38-bin.jar"/>
     </resources>

2. In %JBOSS_HOME%/standalone/configuration/standalone-full.xml configuration file modify the default database connection details parameters:

```
<xa-datasource-property name="ServerName">
        localhost
</xa-datasource-property>
<xa-datasource-property name="DatabaseName">
        domibus
</xa-datasource-property>
<security>
        <user-name>edelivery</user-name>
        <password>edelivery</password>
</security>
```

3. Copy the keystores in %JBOSS_HOME%/conf/domibus/keystores and modify the domibus-security.xml if you are not using the sample keystores

4. Start Wildfly using the standalone-full.xml profile:

%JBOSS_HOME%/bin/standalone.bat --server-config=standalone-full.xml
